Sample Library Catalogue Guide

How to test catalogue search and availability with demo records

Important: The catalogue data is simulated. Use the accompanying JSON/CSV files for structured availability lookups.

How to interpret this catalogue

This is fictional structured sample data for a hackathon prototype. Book metadata is included to test catalogue search, filtering and availability display. Copy counts and shelf locations are simulated, not live holdings.

Use the JSON or CSV file for deterministic catalogue lookups. Do not infer current availability from the PDF documents or ask the LLM to guess it.

Availability fields

total_copies is the simulated total number of copies. available_copies is the simulated number currently available. A title with zero available copies is shown as unavailable in this dataset.

The location values are mock shelf labels created for the demo. They do not identify a real library location.

Suggested tests

Search for 'books about artificial intelligence' and return relevant catalogue titles.

Check whether 'Designing Data-Intensive Applications' is available; the sample record has zero available copies.

Find the shelf location for 'Clean Code'.

Search for a title that does not exist and return not_found instead of fabricating a catalogue record.
